Guidelines for Treatment of Infections in Primary Care in Hull and East Riding

The guidelines have been subject to consultation within primary care, public health and clinicians within the Acute Trust and have been approved by the Advisory Committee on Antimicrobial Therapy (ACAT).

Dr Gavin Barlow
Consultant in Infectious Diseases
Hull and East Yorkshire Hospitals NHS Trust

A summary table of main guidance can also be found at http://www.hey.nhs.uk/herpc/prevention-infection.htm

Note: Doses are oral and for adults unless otherwise stated. Please refer to BNF for further information. A+ = systematic review, A- = rigorous RCT, B+ = RCT or cohort study, B- = case-control study, C = formal combination of expert opinion.

HERPC Guidelines for the Treatment of Infections in Primary Care. Date Approved: September 2017  
Review Date: September 2020
**Aims of Guidelines**
- To provide a simple, evidence-based approach to the empirical treatment of common infections
- To promote the safe, effective and economic use of antibiotics
- Minimise the risk of toxicity/adverse effects e.g. *Clostridium difficile* associated diarrhoea (CDAD)
- Delay the emergence and reduce the prevalence of bacterial resistance in the community

**Principles of Treatment**
- This guidance is based on the best available evidence. Professional judgement should be used and patients should be involved in the decision.
- Prescribe an antibiotic only when there is likely to be a clear clinical benefit (and where benefits outweigh risks).
- It is important to initiate antibiotics as soon as possible in severe infection.
- Have a lower threshold for antibiotics in immunocompromised or those with multiple morbidities; consider culture and seek advice.
- Do not prescribe an antibiotic for viral sore throat, simple coughs and colds.
- Consider a no, or delayed, antibiotic strategy for acute self-limiting upper respiratory tract infections.
- Limit prescribing over the telephone to exceptional cases.
- Use simple generic antibiotics first whenever possible. Avoid broad spectrum antibiotics (e.g. quinolones, cephalosporins, clindamycin, co-amoxiclav) when narrow spectrum agents remain effective, as use of broad spectrum agents increase the risk of *Clostridium difficile*, MRSA and resistant UTIs.
- Cephalosporins and quinolones should **NOT** routinely be used as first line antimicrobials except where indicated in this guidance.
- Macrolide antibiotics should be only be prescribed in preference to penicillins where the patient is **truly hypersensitive** (penicillin allergy is presence of rash or anaphylaxis following treatment with a penicillin).
- The recommended macrolide for general use is clarithromycin (except in pregnancy and breast feeding) due to improved tolerability, absorption and compliance compared to erythromycin.
- Avoid **widespread** use of topical antibiotics (especially those agents also available as systemic preparations) e.g. fusidic acid (Fucibet®, Fucidin®, - ophthalmic use ok).
- In pregnancy **AVOID** tetracyclines, aminoglycosides, quinolones, and **high dose** (> 400mg) metronidazole. Short term use of trimethoprim after the first trimester (unless low folate status or on other folate antagonists e.g. antiepileptics) is unlikely to cause harm to the foetus.
- In children **AVOID** tetracyclines and quinolones.
- Give antibiotics for the **SHORTEST** time possible. In most uncomplicated and non-serious/non-severe infections 5 days of treatment or less is usually sufficient.
- When first-line antibiotic sensitivities are provided, further sensitivity results are usually available for special situations. Consultant medical microbiologists can be contacted for specialist advice by Registered Medical Practitioners on 01482 674991 during laboratory hours or out of hours (for urgent advice) via HEY switchboard 01482 875875.

**Use TARGET toolkit as a resource to optimise antibiotic prescribing within primary care settings**

---

**Note:** *Doses are oral and for adults unless otherwise stated. Please refer to BNF for further information.*

A+ = systematic review, A- = rigorous RCT, B+ = RCT or cohort study, B- = case-control study
C = formal combination of expert opinion.
General information on prescribing recommendations

The information contained within this document is for guidance to assist in the prescribing of antimicrobials. The doses specified are recommended for use in those with normal pharmacokinetic handling of the drug. Dose adjustments may be necessary in children or those of advanced age or with co-morbidities that could affect the pharmacokinetics of the drug (e.g. liver or renal impairment, pregnancy). Certain drug interactions may also have an impact on anti-microbial drug dosing.

Before prescribing, the information contained within these guidelines should be read in conjunction with the most recent British National Formulary (www.bnf.org or www.bnfc.org) or the electronic medicines compendium www.medicines.org.uk for contraindications, cautions, use in pregnancy/ breast feeding and other disease states (e.g. renal or hepatic impairment) and drug interactions.

Unless otherwise stated the doses are for ADULT patients.

Note: **Doses are oral and for adults unless otherwise stated. Please refer to BNF for further information.**
A+ = systematic review, A- = rigorous RCT, B+ = RCT or cohort study, B- = case-control study
C = formal combination of expert opinion.
Main risk factors for *Clostridium difficile* infection (CDI)

Risk factors for CDI are given below. The more of these risk factors a patient has, the higher the risk is likely to be.

- Age >65 years (especially >75 years)*
- Previous CDAD*
- Recent exposure to cephalosporins*, quinolones* or clindamycin* or other broad-spectrum antibiotics such as co-amoxiclav (Augmentin®) – see graph below
- Recent prolonged*/multiple* or IV antibiotic exposure (especially if antibiotics above)
- Nursing/residential home resident
- NG or PEG tube in-situ
- Recent hospital stay
- Extensive co-morbidity
- Gastrointestinal surgery
- Severe underlying/inter-current illness
- Low albumin/poor nutritional status
- H₂ antagonist or proton pump inhibitor therapy (*Ask, does the patient really need this? Consider stopping*)
- Immunosuppression

These are probably the most important, particularly in combination.

**RISK OF COMMUNITY-ASSOCIATED CDI FOR DIFFERENT ANTIBIOTICS**

Linear association between a 4-point antibiotic risk index and community-associated CDI risks.

*Note: Doses are oral and for adults unless otherwise stated. Please refer to BNF for further information.*

A+ = systematic review, A- = rigorous RCT, B+ = RCT or cohort study, B- = case-control study
C = formal combination of expert opinion.
Additional guidance on sampling

Catheter Urine Specimens
By 14 days post-catheterisation, almost all urine samples from catheterised patients will yield bacterial growth. There is no evidence that giving antibiotics to asymptomatic catheterised patients will produce any clinical benefit whilst they are asymptomatic, and antibiotics do not cure catheter blockage, by-passing of catheters, peri-urethral discharge, and are not an appropriate solution to malodorous urine.

Repetitious use of antibiotics produces selection of highly-resistant strains of bacteria and culminates in colonisation with yeasts. Subsequent manipulation of the catheter may result in bacteraemia bloodstream infection with these resistant bacteria and fungi. It is therefore inappropriate to test for the current bacteria present in the urinary system where the patient has no symptoms, except when manipulation of the urinary tract is planned i.e. a urological procedure. In those cases it is appropriate to send a pre-procedure sample, allowing sufficient time (72 hours) for the sample to arrive and for sensitivity tests to be performed.

Routine catheter replacement does not require antibiotic prophylaxis. If a patient is treated for catheter associated UTI, the catheter must be changed whilst patients is on antibiotics.

Wound Swabs, Ulcers of the Skin, Pressure sores, Surface Abrasions and Drain sites
Breachs in the skin result in fluid exudate in a considerable proportion of wounds. The fluid is highly nutritious for bacteria and the growth of a number of organisms to a high level is to be expected. Swabs of such wounds will therefore yield growth. The use of antibiotics in such circumstances will be futile in improving the patient’s condition where no clinical evidence of infection is present.

Specimens from wound swabs should therefore state that redness, swelling, pain, pus or systemic infection is evident (CRP is a useful test to demonstrate systemic infection) and should state the intended antibiotics which should be started after the swab has been obtained. A swab is always a poor substitute for obtaining pus and if pus is available, this should be placed in a sterile container and sent instead of a swab. The same considerations apply to ulcers of the skin, pressure sores, surface abrasions and drain sites.

Note: Doses are oral and for adults unless otherwise stated. Please refer to BNF for further information.
A+ = systematic review, A- = rigorous RCT, B+ = RCT or cohort study, B- = case-control study
C = formal combination of expert opinion.

C = formal combination of expert opinion.
### LOWER RESPIRATORY TRACT INFECTIONS

**Note:** Low doses of penicillins are more likely to select out resistance. Do **NOT** use quinolones (ciprofloxacin and ofloxacin) first line due to poor activity against pneumococci. However, they do have use in PROVEN pseudomonal infections. Reserve ALL quinolones for proven resistant infections.

**URINARY TRACT INFECTIONS**

**Note:** Amoxicillin resistance is common therefore only use if culture confirms susceptibility.

**Do not treat asymptomatic bacteriuria in adults except in pregnancy:** it is common (especially in > 65 years) but is not associated with increased morbidity. In this population urine cultures are useful only to exclude UTI not to make a diagnosis.

**In the presence of a catheter, antibiotics will not** eradicate bacteriuria and will select out more resistant organisms making subsequent treatment more difficult; only treat if systemically unwell or evidence of pyelonephritis. **Do not use prophylactic antibiotics for catheter changes unless history of catheter-change-associated UTI or trauma** (NICE & SIGN guidance).

### Note

*Doses are oral and for adults unless otherwise stated. Please refer to BNF for further information.*

A+ = systematic review, A- = rigorous RCT, B+ = RCT or cohort study, B- = case-control study

C = formal combination of expert opinion.
**Note:** People with risk factors should be screened for Chlamydia, gonorrhoea, HIV, syphilis. Refer individual and partners to GUM service. Risk factors: <25y, no condom, recent (<12mth)/frequent change of partner, symptomatic partner, area of high HIV

Refer patients with STIs, including trichomoniasis, to GUM clinic for contact tracing. If laboratory testing for test of cure in Chlamydia infection is required then it should be performed at least 3 weeks after the initiation of therapy to avoid false positive results

### GENITO- URINARY TRACT INFECTIONS – always check BASHH guidance [https://www.bashh.org/guidelines](https://www.bashh.org/guidelines)

### Pelvic Inflammatory Disease (PID)

**Test for Chlamydia & N. gonorrhoea**

Refer patients and contacts to GUM clinic

These regimens are not for use in pregnancy. Please discuss these cases with secondary care.

28% of gonorrhoea isolates now resistant to quinolones, so only use ofloxacin based regimens if gonococcal PID unlikely.

Page 17 of 26
### Acute diverticulitis

Mild uncomplicated diverticulitis can be managed at home with paracetamol (avoid NSAIDS, opioids) and clear fluids. There is conflicting evidence on benefit of antibiotics but several guidelines recommend this. Admit if pain cannot be managed with paracetamol, hydration cannot be maintained, significant comorbidities likely to complicate recovery, suspected complications (e.g. rectal bleeding, perforation, abscess) or if not improving.

** Co-trimoxazole – reduce dose by 50% if GFR 15-30 ml/min/1.73m² and avoid if GFR < 15ml/min/1.73m² – do not use in patients prescribed drugs which increase potassium (e.g. ACE, ARB, potassium sparing diuretics)

<table>

### Gastroenteritis

Refer previously healthy children with acute painful or bloody diarrhoea to exclude *E coli 0157* infection.

** Antibiotic therapy is not indicated unless systemically unwell**

Initiate treatment, on advice of microbiologist, if the patient is systemically unwell (e.g. clarithromycin 500mg BD for 5-7 days, if campylobacter suspected and treated early)

Please notify suspected cases of food poisoning to, and seek advice on exclusion of patients, from Public Health Doctor ☎ 01482 672171 (9am-5pm) Send stool samples in these cases.

### Traveller’s Diarrhoea

Limit prescription of antibacterial to be carried abroad and taken if illness develops. (Ciprofloxacin 500mg twice daily for 3 days or 500mg stat dose, as a private prescription) Restrict to people travelling to remote areas and for people in whom an episode of infective diarrhoea could be dangerous.

Consider referral of suspected infectious diarrhoea following travel to Department of Infection and Tropical Medicine, Hull and East Yorkshire Hospitals NHS Trust.

### Threadworm

Treat all household contacts at the same time. Advise morning shower / baths, pants at night and hand hygiene for 2 weeks.

PLUS wash sleepwear, bed linen, dust and vacuum on day 1.

First trimester of pregnancy – hygiene only

Second and third trimester of pregnancy – use piperazine

Review Date: September 2020
| **MRSA / MSSA** | **Skin colonisation** | **Give treatment for skin decolonisation when advised by specialist team**  
Naseptin should be used (for 10 days) instead of mupirocin nasal ointment if the isolate is known to be mupirocin resistant.  
48 hours after course complete patient should be re-swabbed.  
If patient not decolonised – seek specialist advice | mupirocin 2% nasal ointment  
And  
Octenidine (Octenisan body wash)  
OR  
Naseptin cream  
And  
Chlorhexidine 4% Aq Soln | Apply to nostrils TDS  
Wash DAILY (incl 2 hair washes) | 5 days |
| **MRSA active infection** | **MRSA confirmed with lab results**  
Seek specialist advice | doxycyclineB (12yrs only)  
(Ensure isolate is doxycycline sensitive)  
Other treatment options – discuss with specialist | 100mg BD | 7 days |
| **PVL producing Staphylococcus aureus** | **Panton-Valentine Leukocidin (PVL) is a toxin produced by 4.9% of S. aureus. Can rarely cause severe invasive infections in healthy people. Send swabs if recurrent boils/ abscesses. Risk factors; Close contact in communities or sport; poor hygieneC.** |  |  |  |
| **Leg ulcers** | **Routine swabs are not recommended. Antibiotics are only indicated if cellulitis is presentA, and do not improve healing. Cultures / swabs are only indicated if diabetic or there is evidence of clinical infection, e.g. inflammation or redness / cellulitis, increased pain, purulent exudates, rapid deterioration of ulcer or pyrexia. Sampling requires cleaning then vigorous curettage and aspiration.**  
If active infection, treat as cellulitis (as above). Refer for specialist opinion if severe infectionC. |  |  |  |
| **Eczema** | **Using antibiotics, or adding them to steroids in eczema does not improve healing unless there are visible signs of infectionB. Where treatment indicated treat as per ImpetigoC.** |  |  |  |
| **Bites** | **Animal bite** | **Thorough irrigation is importantC. Assess tetanus and rabies riskC.**  
Antibiotic prophylaxis advised for – puncture wounds, bite involving hand, face, foot, joint, tendon or ligament. It is also recommended for at risk patients e.g. diabetic, asplenic, immunosuppressed, cirrhotic, prosthetic valve or joint  
Antibiotic prophylaxis advised; add metronidazole if severe.  
Assess tetanus, HIV/hepatitis B & C risk | First line animal & human prophylaxis and treatment  
co-amoxiclavC  
Penicillin allergic in ADULTS:  
metronidazole  
plus  
doxycycline  
Penicillin allergic in CHILDREN:  
clindamycin | First line animal & human prophylaxis and treatment

## DENTAL INFECTIONS

This guidance is not designed to be a definitive guide to oral conditions. It is for GPs for the management of acute oral conditions pending being seen by a dentist or dental specialist. GPs should not routinely be involved in dental treatment and, if possible, advice should be sought from the patient’s dentist, who should have an answer-phone message with details of how to access treatment out-of-hours, or call NHS 111.

### ILLNESS | COMMENTS | DRUG | DOSE | DURATION OF Tx
--- | --- | --- | --- | ---
**Mucosal ulceration and inflammation** **(simple gingivitis)** | • Temporary pain and swelling relief can be attained with saline mouthwash$^{1C}$  • Use antiseptic mouthwash: If more severe & pain limits oral hygiene to treat or prevent secondary infection.$^{2C}$  
The primary cause for mucosal ulceration or inflammation (aphthous ulcers, oral lichen planus, herpes simplex infection, oral cancer) needs to be evaluated and treated. | Simple saline mouthwash$^{1C}$  Chlorhexidine 0.12% - 0.2%$^{2A+}$ (Do not use within 30 mins of toothpaste)  Hydrogen peroxide 1.5%$^{6A}$ (spit out after use) | ½ tsp salt dissolved in glass warm water  Rinse mouth for 1 minute BD with 5 ml diluted with 5-10 ml water.  Rinse mouth for 1 min QDS (after meals & bedtime) | Always spit out after use.  Use until lesions resolve or less pain allows oral hygiene:

**Acute necrotising ulcerative gingivitis**$^{6A}$ | Commence metronidazole$^{7C}$ and refer to dentist for scaling and oral hygiene advice$^{C}$  
Use in combination with antiseptic mouthwash if pain limits oral hygiene | Metronidazole$^{7C}$ AND Chlorhexidine or hydrogen peroxide | 400 mg TDS  see above dosing in mucosal ulceration | 3 days  Until oral hygiene possible

**Pericoronitis**$^{1B}$ | Refer to dentist for irrigation & debridement$^{1C}$  
If persistent swelling or systemic symptoms use metronidazole.$^{1.5A}$  
Use antiseptic mouthwash if pain and trismus limit oral hygiene | Amoxicillin AND Metronidazole$^{1.7C}$ AND Chlorhexidine or hydrogen peroxide | 500 mg$^6$ TDS  400 mg TDS  see above dosing in mucosal ulceration | 3 days  3 days  Until oral hygiene possible

**Dental abscess**$^{8A}$ | • Regular analgesia should be first option until a dentist can be seen for urgent drainage, as repeated courses of antibiotics for abscess are not appropriate.$^1$  
Repeated antibiotics alone, without drainage are ineffective in preventing spread of infection.  • Antibiotics are recommended if there are signs of severe infection, systemic symptoms or high risk of complications.$^{2,3}$  
• Severe odontogenic infections; defined as cellulitis plus signs of sepsis, difficulty in swallowing, impending airway obstruction, Ludwigs angina. Refer urgently for admission to protect airway, achieve surgical drainage and IV antibiotics.  
The empirical use of cephalosporins,$^8$ co-amoxiclav, clarithromycin, and clindamycin do not offer any advantage for most dental patients and should only be used if no response to first line drugs when referral is the preferred option.$^{6,12C}$  

| If pus drain by incision, tooth extraction or via root canal.$^{1.7B}$ Send pus for microbiology.  
True penicillin allergy: use clarithromycin or clindamycin$^{7}$ if severe. 1. If spreading infection (lymph node involvement, or systemic signs ie fever or malaise) ADD metronidazole$^{10C}$ | Amoxicillin$^2$ or Phenoxyxymethylpenicillin$^1$  True penicillin allergy: Clarithromycin  Severe infection add Metronidazole$^{8,10}$ or Clindamycin$^{3,8-11}$ | 500 mg$^2$ TDS  500 mg$^3$ – 1g QDS  500 mg BD  400 mg TDS  300mg QDS | Up to 5 days review at 3d$^{11}$  5 days  5 days$^{11}$

The primary reference sources for these guidelines were:

Further references are listed in main text or can be found in original PHE document, listed above.

This guidance was initially developed in 1999 by practitioners in South Devon, as part of the S&W Devon Joint Formulary Initiative, and Cheltenham & Tewkesbury Prescribing Group and modified by the PHLS South West Antibiotic Guidelines Project Team, PHLS Primary Care Co-ordinators and members of the Clinical Prescribing Sub-group of the Standing Medical Advisory Committee on Antibiotic Resistance. It was further modified following comments from Internet users. If you would like to receive a copy of this guidance with the most recent changes highlighted please email the author cliodna.mcnulty@phe.gov.uk

The guidance has been updated regularly as significant research papers, systematic reviews and guidance have been published. Public Health England (previously Health Protection Agency) works closely with the authors of the Clinical Knowledge Summaries.

Grading of guidance recommendations

The strength of each recommendation is qualified by a letter in parenthesis.
